## 5 Geometry

### 5.1 Green's Theorem

Let  $C$  is positive, smooth, simple curve.  $D$  is region bounded by  $C$ .

$$\oint_C (Ldx + Mdy) = \iint_D \left( \frac{\partial M}{\partial x} - \frac{\partial L}{\partial y} \right)$$

To calculate area,  $\frac{\partial M}{\partial x} - \frac{\partial L}{\partial y} = 1$ , common selection is  $M = \frac{1}{2}x$ ,  $L = -\frac{1}{2}y$ .

Line integral of circle parametrized by  $(x, y) = (x_C + r_C \cos \theta, y_C + r_C \sin \theta)$  is given as

follows.:  $\frac{1}{2}(r_C(x_C(\sin \theta_f - \sin \theta_i) - y_C(\cos \theta_f - \cos \theta_i)) + (\theta_f - \theta_i)r_C^2)$ .

Line integral of line parametrized by  $(x, y) = t(x_1, y_1) + (1 - t)(x_2, y_2)$  is given as follows.:  $\frac{1}{2}(x_1y_2 - x_2y_1)$ .

```

inline double arc_area(double x, double y, double r, double s, double e){ //s and e
are line integral theta value.
    return (r*(x*(sin(e)-sin(s))-y*(cos(e)-cos(s)))+(e-s)*r*r)*0.5;
}

## 7 Miscellaneous

### 7.1 Popular Optimization Technique

- **NO. THE PROBLEM IS ACTUALLY EASY. YOU JUST READ IT WRONG**
- Add or remove the constraints / Simplify the problem / Solve similar problem
- "Colliding ants problem" : Find a better way to describe the situation
- CHT. DnC optimization. Mo's ~~algorithm~~ trick (on tree). IOI 2016 Aliens trick. IOI 2009 Regions trick.
- Knuth's  $O(n^2)$  Optimal BST : minimize  $D_{i,j} = \min_{i \leq k < j} (D_{i,k} + D_{k+1,j}) + C_{i,j}$ . Quadrangle Inequality :  $C_{a,c} + C_{b,d} \leq C_{a,d} + C_{b,c}$ ,  $C_{b,c} \leq C_{a,d}$ . Now monotonicity holds.
- Sqrt batch processing - Save queries in buffer, and update in every sqrt steps (cf : IOI 2011 Elephant. hyea calls it "ainta technique")
- Dynamic insertion in static set (Make  $O(\lg n)$  copy. Merge like binomial heap.)
- Offline insertion / deletion in insert-only set (Pair insertion-deletion operation, and regard it as range query)
- Atcoder Median Pyramid : Reduce the input to binary, and solve the easier problem.

### 7.2 Bit Twiddling Hack

```

int __builtin_clz(int x); //number of leading zero
int __builtin_ctz(int x); //number of trailing zero
int __builtin_clzll(long long x); //number of leading zero
int __builtin_ctzll(long long x); //number of trailing zero

    while (c > 32) x = 10 * x + (c - '0'), c = _read();
    if (s < 0) x = -x;
    return x;
}
```

### 7.4 OSRank in g++

```
